E03 Regularized harness improvement

Evolution / OBJECT INTERACTION / ANALYTICAL COLLABORATION

Limit overfitting during repeated edits.

OBJECT INTERACTION

solid arrow: call/message · dashed open arrow: return/failure · analytical order, not an observed trace

POINTCUT / PATTERN INTERFACE	
CONTEXT	Multiple harness edits are proposed over repeated rounds.
TRIGGER	An evaluator accepts or rejects an edit.
STRUCTURE	Validation split, regularization signal, edit budget, and final holdout.
EFFECT	Selection controls complexity and overfitting before final evaluation.

CONTRACT / REQUIRED BEHAVIOR	
REQUIRES	Acceptance and final evaluation data have distinct roles.
ENSURES	Accepted edits include the screening evidence that justified them.
INVARIANT	Final holdout is not used for iterative selection.
VIOLATION	Leakage or unstable gain stops acceptance or downgrades the claim.

Sources: protocol/pattern_diagram_models.yaml (participants + messages); protocol/harness_pattern_specification.yaml (pointcut + contract).

Analytical collaboration only; no repository execution or message order is asserted.
