P26 Session-tree version control

Primitive / OBJECT INTERACTION / ANALYTICAL COLLABORATION

Branch or revisit execution history.

OBJECT INTERACTION

solid arrow: call/message · dashed open arrow: return/failure · analytical order, not an observed trace

POINTCUT / PATTERN INTERFACE

CONTEXT	Execution history can be checkpointed and branched.
TRIGGER	A fork, checkout, rewind, or restore is requested at an event boundary.
STRUCTURE	Node identity, ancestry, checkpoint payload, and branch creation operation.
EFFECT	The new branch starts from the requested stable history without mutating its ancestors.

CONTRACT / REQUIRED BEHAVIOR

REQUIRES	Event boundary is stable and enough state exists to resume.
ENSURES	New branch records parent, boundary, and provenance; invalid boundaries are rejected.
INVARIANT	Branch operations never rewrite unrelated history.
VIOLATION	External side effects are not rolled back and must be reported as irreversible.

Sources: protocol/pattern_diagram_models.yaml (participants + messages); protocol/harness_pattern_specification.yaml (pointcut + contract).

Analytical collaboration only; no repository execution or message order is asserted.
